1. Membuat file bernama Page.php didalam folder controller

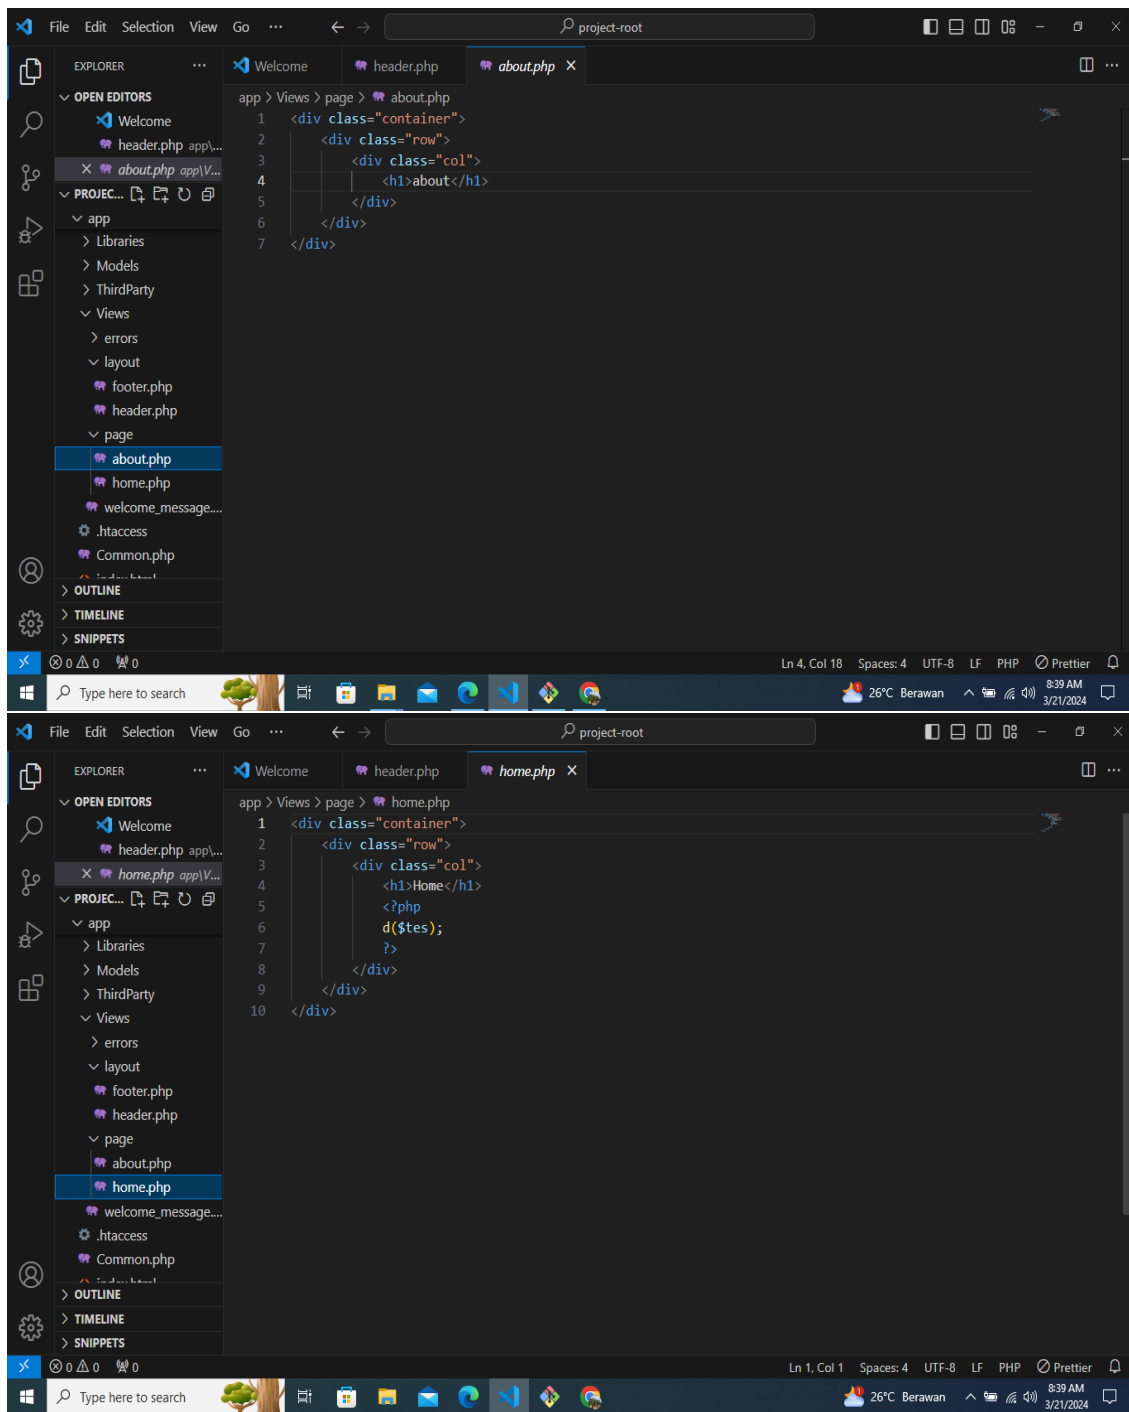

The screenshot shows the Visual Studio Code interface with a project named 'project-root'. The Explorer sidebar on the left shows the file structure, with the 'Controllers' folder expanded. The 'Page.php' file is highlighted in the Explorer and is also open in the editor. The editor displays the following PHP code:

```
1 <?php
2
3 namespace App\Controllers;
4
5 class Page extends BaseController
6 {
7     public function index()
8     {
9         $data = [
10             'title' => 'Home | Unipdu Press',
11             'tes' => ['satu', 'dua', 'tiga']
12         ];
13         echo view('layout/header', $data);
14         echo view('page/home', $data);
15         echo view('layout/footer');
16     }
17
18     public function about()
19     {
20         $data = [
21             'title' => 'Home | Unipdu Press',
22             'tes' => ['satu', 'dua', 'tiga']
23         ];
24         echo view('layout/header', $data);
25         echo view('page/about');
26         echo view('layout/footer');
```

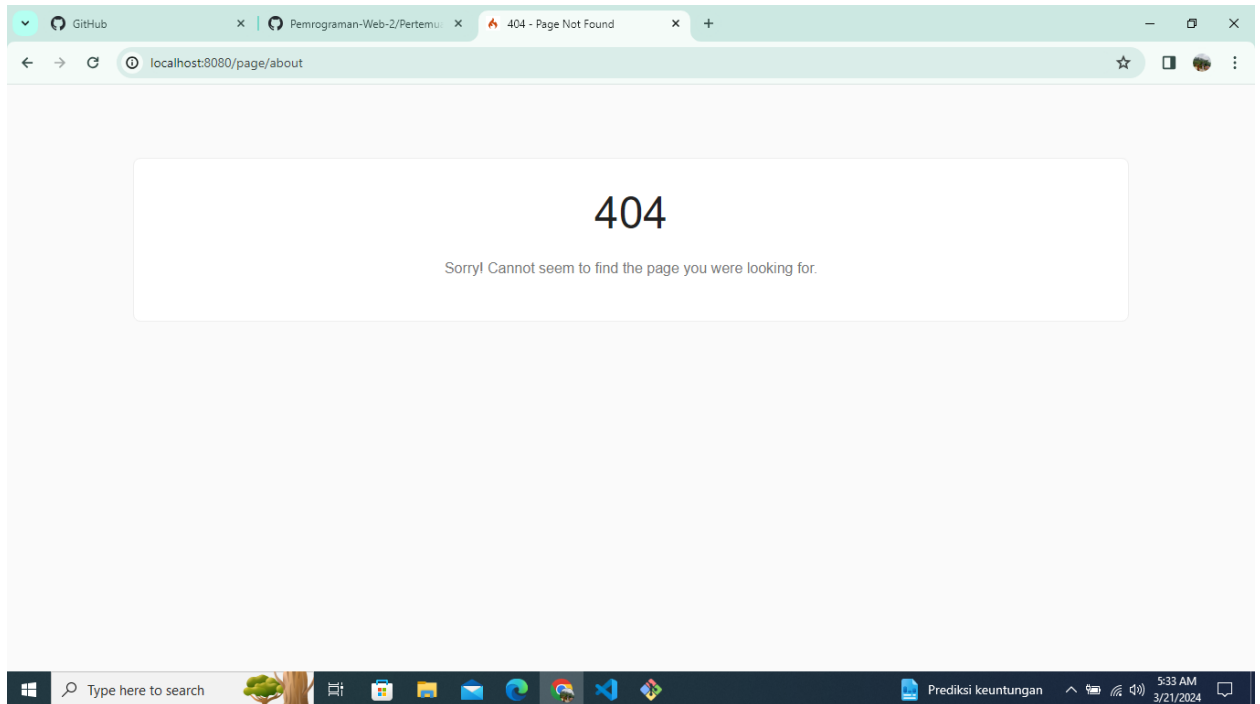

The status bar at the bottom indicates the current line and column (Ln 1, Col 1), the number of spaces (4), the encoding (UTF-8), the line ending (LF), the language (PHP), and the formatter (Prettier). The system tray at the bottom right shows the temperature (26°C), location (Berawan), and time (8:38 AM 3/21/2024).

2. Buat folder lagi didalam folder view bernama page lalu buat file home.php dan about.php

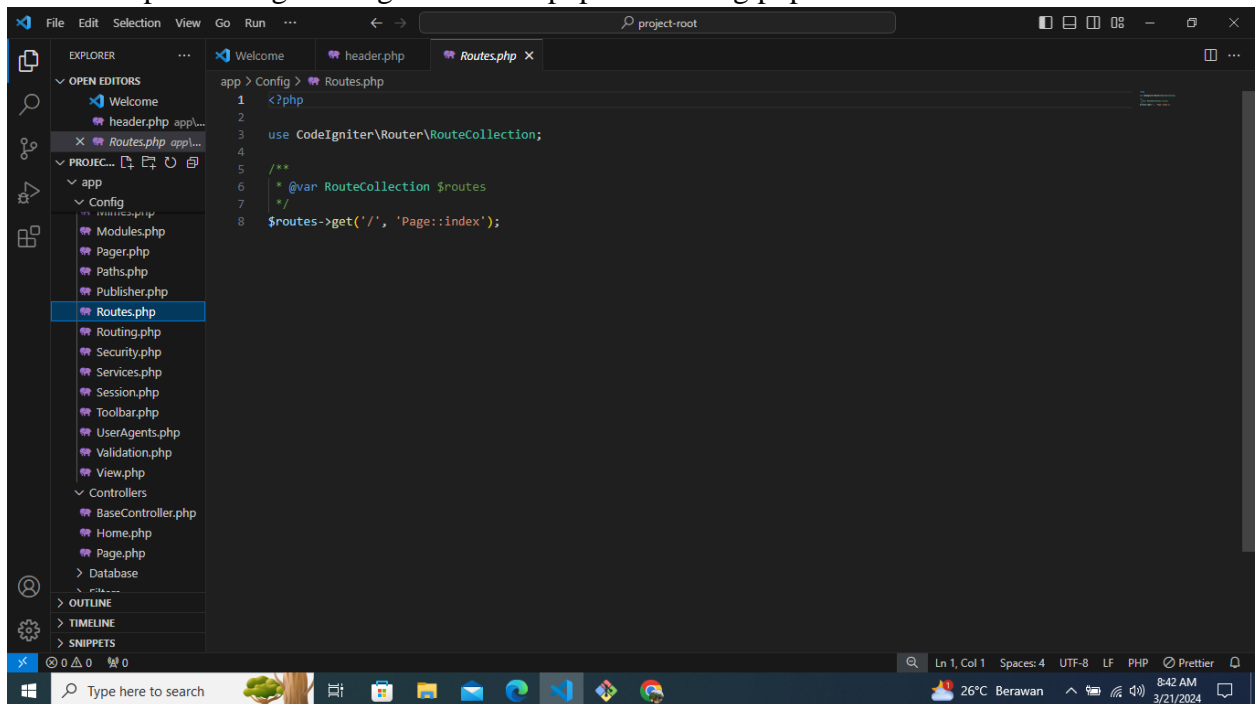

3. Buat lagi folder bernama layout didalam folder view dan buat file header.php dan footer.php

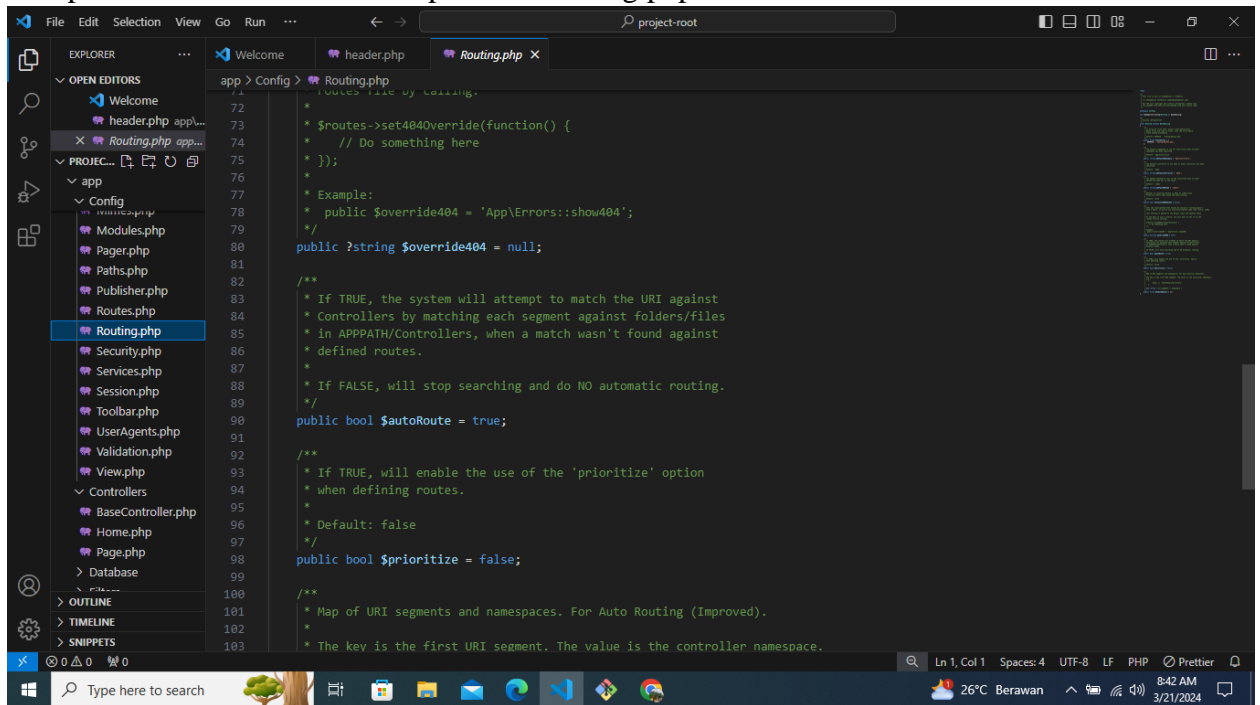

4. Untuk menjalankan coba ketik <https://localhost:8080> jika keluar error seperti yang dibawah ini

Maka kita perlu mengecek lagi file routes.php dan routing.php

Dan pastikan `$autoRoute = true` pada file `routing.php` di baris 90

5. Lalu coba refresh halaman sebelumnya, jika muncul seperti gambar dibawah maka setting view telah berhasil
